 \*\*\*\*\*.Grasses occupy a greater area of the world s land surface  
 than any other plant family, occurring in almost every  
 terrestrial environment and providing a vital source of food for  
 humans and animals. This volume presents the most recent  
 information on their population biology, bringing together  
 contributions from researchers studying both applied and  
 fundamental aspects of this important group of plants.  
 Demographic, physiological, ecological and molecular  
 approaches to understanding grass populations are  
 considered in relation to reproduction and to aspects of life  
 history patterns such as dispersal, germination, seedling  
 establishment, population dynamics and reproduction. Other  
 areas covered include the role of genetic variation and  
 phenotypic plasticity in shaping life history traits, the impact of  
 biotic factors, and the ecology of specific species in major  
 grass-dominated ecosystems in Africa, Australia and Japan.
